

ABS Level I Basic

System properties

Version 2.0

Agenda

- 1 Introduction
- 2 Functional architecture
- 3 Technical architecture
- 4 Core release management
- 5 Summary

Content of the module

What can you expect in this unit?

You get an insight into:

functional and technical view of ABS

Basic information about the data model

Functional and technical architecture

Core release management

IT architecture (A3K Framework, Client and Batch)

ABS Core concepts

ABS is developed as inventory management system for (large) insurance companies.

1

- 1** Introduction
- 2** Functional architecture
- 3** Technical architecture
- 4** Core release management
- 5** Summary

Functional structure

Which functions can be differentiated in ABS?

Basic functionalities	Define basic functionalities for a specific functional application area of the ABS insurance system.
Cross-cutting functionalities	Are general functionalities, which can be used independently of the functional areas of application (e.g. commission).

Features of ABS

All class system (All insurance classes are within one system and one database)

Homogeneous (functions in ABS are developed uniform and similar)

Functionally comprehensive and complete (all functionalities necessary for the operation of an insurance are provided in the system)

All insurance areas (life insurance, health insurance, non-life insurance) always use all basic functionalities, cross-cutting functionalities are not necessarily used.

Structural design (extract)

How is ABS structured?

Business functionalities can be adapted to ABS customer's requirements using defined interfaces.

Company-wide Unified Data Model (UDM)

How can data be changed in UDM?

Data in the company-wide database can be changed and queried via various channels.

Data model (extract)

How is the data model structured?

ABS is based on a company-wide unified data model, which is implemented in a relational database and distinguishes between defining and operational data.

- 5 Summary

Usage and extensions of the Core modules

How can the core modules be used and modified?

Core modules can only be extended via requests to the Core Competence Center (CCC).

CCC decides whether the request is implemented by extending the Core module or the customer is provided with an interface for independent implementation.

Changes and extensions of Core modules are always tracked in the functional Core concepts and presented to the customers for verification.

Release notes are delivered with each Core release. These contain the description of the implemented core extensions

Central functionality is specified by the CCC. Customer-specific functionalities can be included in the Core.

Basic elements of a file

On which basic elements is the file based?

The screenshot shows a software window titled "Natural person file [Taboga, Daniel] <on DBWAT_EN>". The interface includes a menu bar (File, Debug, Edit, Extras, Window, ?), a toolbar with icons, and a header section displaying personal data: "Taboga Daniel; A-7551 Stegersbach, Steinbachsiedlung 8; 10.04.1937", "English, 60plus/A", "Premium: 2155,90", "Benefit: 320,60", and "Thomas Coric (2137301, Dion: 3) AD". Below the header is a row of top tabs: "Person", "Collection", "HH", "Relation", "Request", "Contract", "Assets", "Claims", "Business Partner", "Accounts", and "Sales". The "Person" tab is active, showing a form with fields for "Last name" (Taboga), "Acad. degree", "Gender", and "F€". To the right of the form is a "Master data" side tab. At the bottom is a status bar with the text "ABS-Kern 13.0.05a.27 for TESTALL is ready.", "EUR", a red circle icon, "Queries", and "current".

Annotations with arrows point to the following elements:

- Action bar
- Toolbar
- File header
- Top tabs
- Status bar
- Side tabs

ABS has a consistent concept for the user interface, represented by files which are constructed in a similar manner. (Top tab/side tab principle)

There can be a branch out from every file to others and several files can be opened simultaneously.

Every screen of a file should be accessible with two mouse clicks (->2 click principle)

The user himself decides the dialog sequence. Recommended processing sequence is from left to right or from top to bottom.

- 5 Summary

Layer architecture

What is layer architecture?

- Manipulation takes place only in the responsible layer
- Individual layers are decoupled from each other
- Use of individual layers by different applications

Layer

Presentation layer (for presentation and interaction with the user)

Business layer (contains the business logic)

Persistence layer (controls transfer of data from/to database)

Host

Local

▶ Separation of program code in layers simplifies maintenance and further development.

Batch Services

What are batches?

Batch are used for rapid mass data processing

The batch programs can be controlled (parallelized, paused, ended) and scaled depending on time and/or work load on the server.

The workload is stored in the database in order to allocate, correct, escalate, delay etc. work volume.

They provide standardised and regular database maintenance.

Batches can be monitored on the application side by various means.

- 5 Summary

Release management

How do the ABS core releases take place?

- **2 major releases incl. DB update per year**
- **In May and in November for Allianz Austria**
- **In June and December for all other ABS customers**
- **Individual releases cannot be skipped; however, the ABS customer can determine the time of the release change**
- **Each release is only supported for one year.**
- **Attention: Defects are only corrected in the supported versions.**

- 1 Introduction
- 2 Functional architecture
- 3 Technical architecture
- 4 Core release management
- 5 Summary**

Summary

What should we keep in mind?

You should now have knowledge about the following:

distinction between basic and cross-cutting functionalities

general structure of the data model

special features of ABS

procedure for functional extension of the Core

basic design of a file

basic technical system properties

process of Core release change

Question 2

Not yet answered

Marked out of 1.00

Next

02-0002: What of the following are basic functions in ABS?

Select one or more:

- ☐ A. Person
- ☐ B. Product
- ☐ C. Claim
- ☐ D. Collection and Disbursement
- ☐ E. Contract
