

ABS Level I Basic

Person

Version 2.0

Agenda

- 1 Introduction
- 2 Functionalities Person
- 3 Functional object Person
- 4 Summary

Contents of the module

What can you expect in this unit?

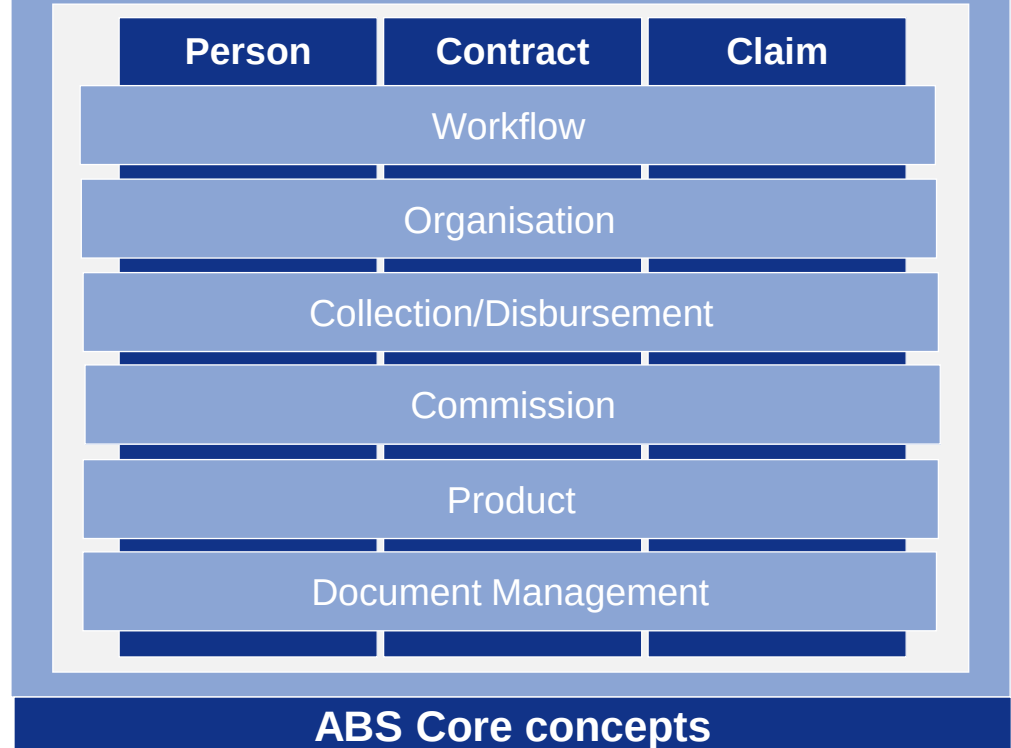

You get an insight into:

Modeling person management in ABS and the most important components.

The functionalities that are provided within person management.

How person management is related to other areas.

IT architecture (A3K Framework, Client, and Batch)

The functional object Person supports all processes required for administrating person data in ABS. All cross-cutting and basic functionalities requiring person data access the functional object Person.

1

- 1** Introduction
- 2** Functionalities Person
- 3** Functional object Person
- 4** Summary

Person management as a central element

How is the person in the center?

Role concept

ABS offers a uniform concept for mapping person roles within their contexts. In person management, specific functionalities are available for individual roles (e.g. intermediary, business partner,...).

Contract partner

Creation of a person forms the origin of a new contractual relation and the associated claims.

Business relation

In the ABS system, the person represents the business relation of the company with the customers, partners, etc.

Business process

Person management in ABS supports all business processes by embedding and reusing person data in the various Functional Objects.

Person management is the central role in ABS, in which all information about a person (regardless of the role in the process) is managed. This information is required to design processes in ABS.

Person management as a central element

How is the person in the center?

Information about and processing of person master data

Processing of general person data (names, addresses,...)

Processing of specific person data (corporate group structure, household,..)

Processing of communication data

Allocation of an account manager

Entering of general collection and disbursement information

Segmentation of persons and relations between persons

Information about contracts of a person

Information about documents

Information about claims

Premium/benefit overview

Example of context Person to the basic functionalities

What is the relationship between the person and the ABS basic functions?

Policy holder	Natural or legal persons, who have signed an insurance contract with an insurance company and are defined therein as bearer of rights and duties to the insurance company.
Insured person	The insured person is the person who represents insured risk in the coverage.
Payer	The policy holder or any natural or legal person stated in the contract, who accepts the obligation to pay the premium.
Injured party	The injured party is an unknown person at the time of conclusion of the contract, who has suffered a loss which must be mitigated by the policy holder.
Insured person	The person who is affected in a claim case.
Annuitant	The person who is stored in the system as a recipient of an insurance benefit in the form of an annuity.

Depending on the assumed person role, the person has different rights and duties. Persons can simultaneously assume several roles in connection with a contract or a claim (e.g. injured party and policy holder)

Example of context of Person to cross-cutting functionalities

What is the relation between the person and the ABS cross-cutting functions?

General Collection/ Disbursement	ABS supports the definition of default collection/disbursement variants, which are then used as standard for contracts or claims. Additionally, the option of applying general collection to all existing contracts exists.
Bank account	ABS supports management of domestic/international bank accounts, which can be used for collection/disbursement.
Customer account	For major customers with several contracts, the option of aggregated collective settlements via a customer account exists.
Agent management	For identification and management of a person as an intermediary/agent, relevant data can be processed via person management in ABS (e.g. agent type, discount class)
Commission account	Every intermediary/agent has one or more commission accounts. For the payment of commissions, bank account data defined for the person are used.
Sales hierarchy	For each intermediary/agent's sales unit information about the related locations customer centre, sales area, directorate, division and general directorate can be queried.
 In the person file, accounts can be managed payment information related to the person can be queried. The data of agent management are basis for the account and contract manager and commissioning.

Data processing in person management

What are the functionalities in person management?

All person management starts with a search.

Person types in ABS

How are natural and legal persons distinguished?

Natural Person

A natural person is a human being in his role as a legal entity, i.e. the bearer of rights and duties (private persons)

Legal Person

A legal person can be an individual, an association of persons or an asset which due to its legal recognition is legally responsible, i.e. may be carrier of rights and duties itself, but is not a natural person. (companies, governmental institutions, associations, self employed)

The person type has influence on

	The offered functionality	(e.g.: household, group structure)
	The possible inputs and validations	(e.g.: gender, legal form)
	The used tables	(eg: TNATPERS, TJURPERS)
	The possible roles	(e.g. insured person always natural)

When searching for persons filtering on person types is possible.

Contact options

Which contact options can be saved for persons?

Querying and editing of communication master data

Persons can be contacted through different means

Persons can be assigned to several addresses (several types, depending on person type)

Depending on the kind of person there exist several types (e.g. natural person's main residence & secondary residence)

Specification of different contact types (email, telephone, fax, ...), as well as flags (private/business) are possible

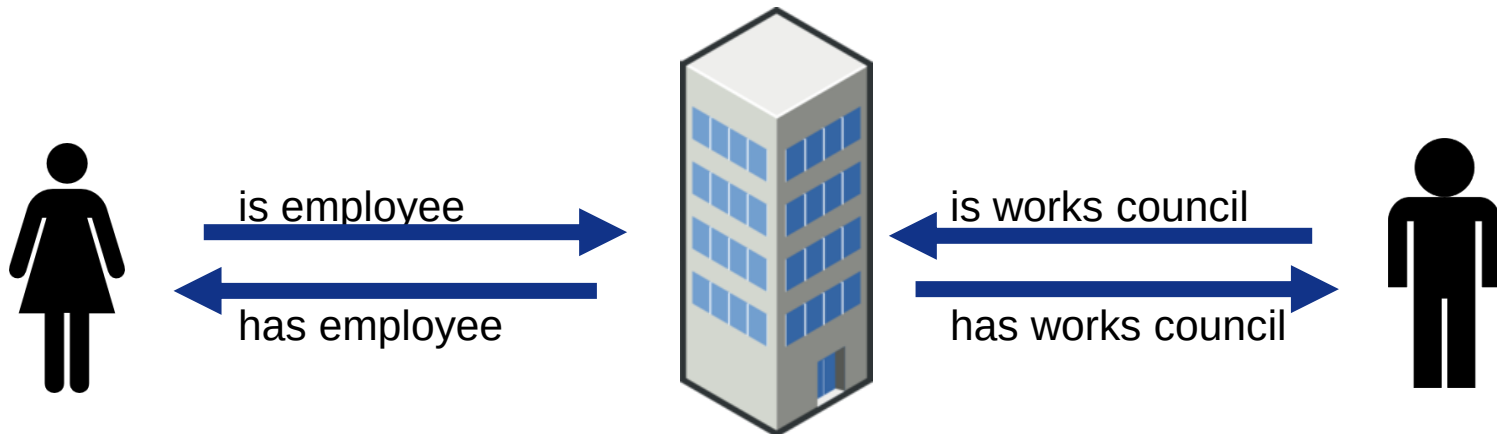

Each entry is uniquely connected to a usage purpose

Relations between persons 1/3

How can connections between persons be mapped?

Relation

Illustration of relationships between persons (generally a natural and a legal person). One direction of the relationship is selected, the other follows automatically.

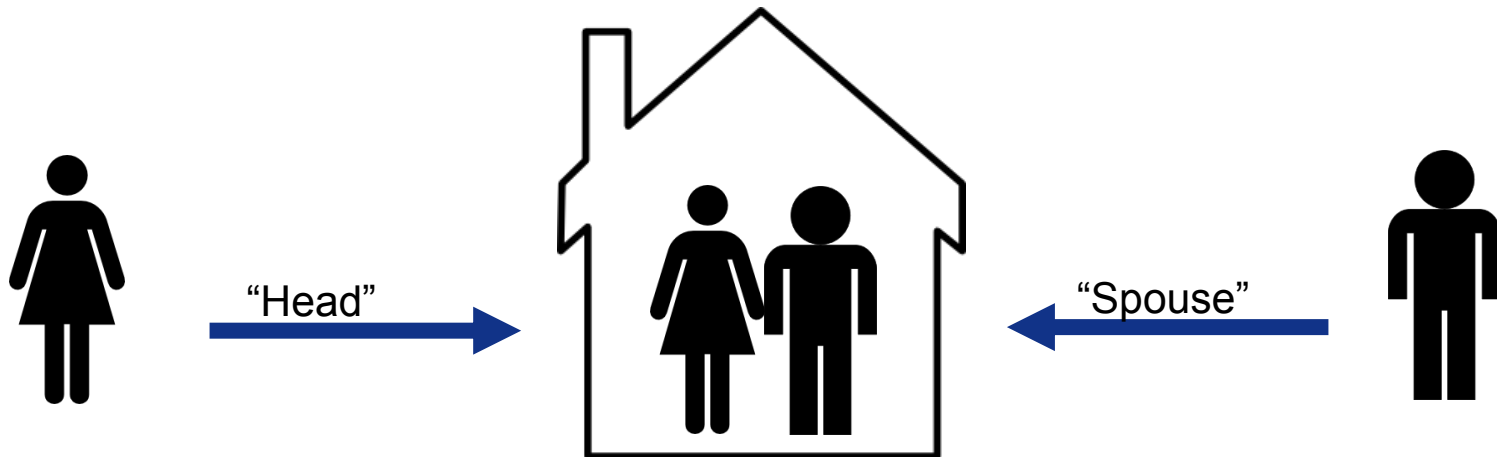

“Relation” between persons is done in the data model via TBEZUG.

Relations between persons 2/3

How can connections between persons be mapped?

Household

Each **natural** person is assigned to a household. Additional persons can be added to this household. In the case of differences, the address and account manager of the added person are adapted automatically.

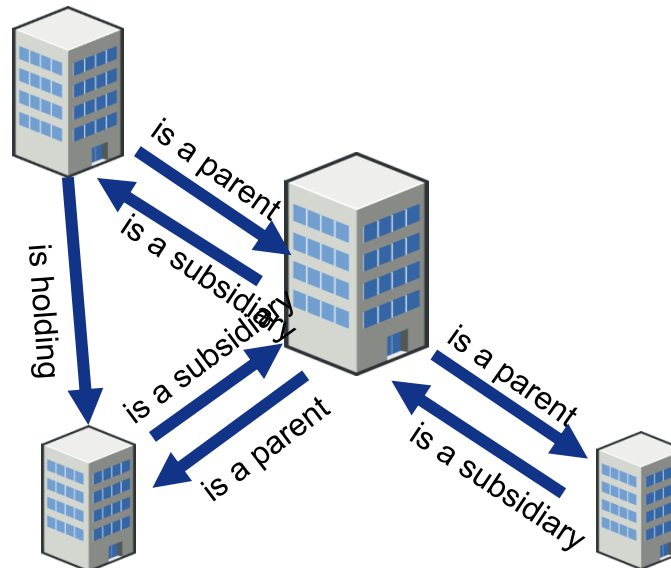

The grouping of persons into a household helps to identify the sales potential and is done in the data model via THHALT.

Relations between persons 3/3

How can connections between persons be mapped?

Corporate Group structure

For **legal** persons, corporate group structures can be mapped including co-insurance relations. Based on the selected person, the highest-order (holding) company, the parent companies and any subsidiaries are displayed.

Documentation of subsidiaries is the starting point for mapping the group hierarchy, which is done in the data model via TKONZMITGL.

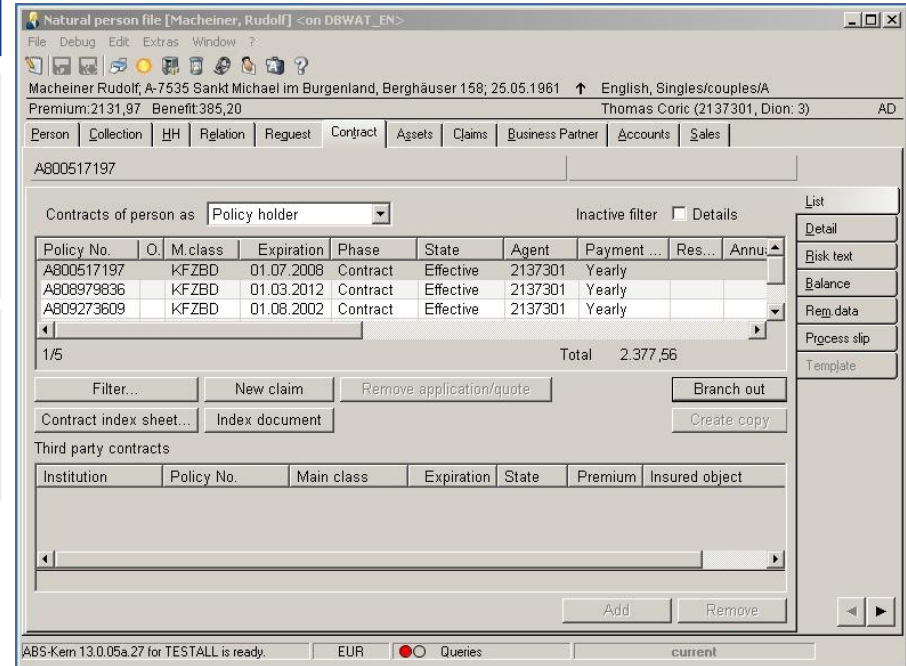

Contract list

Which information does the contract list contain?

Overview of all contracts of a person

List of all quotes, applications and contracts of a person (in the role of a policy holder, insured person, payer, addressee for service)

Available functionalities: Branch out to other files, claim creation, deletion of quotes & incomplete applications

The screenshot shows the 'Natural person file' window for Rudolf Macheiner. The 'Contract' tab is selected, displaying a table of contracts for the role of 'Policy holder'. The table includes columns for Policy No., O., M. class, Expiration, Phase, State, Agent, Payment, Res., and Annu. The first three contracts are listed: A800517197, A808979836, and A809273609, all with an expiration date of 01.07.2008, 01.03.2012, and 01.08.2002 respectively, and a state of 'Effective'. The total premium is 2,377.56. Below the table, there are buttons for 'Filter...', 'New claim', 'Remove application/quote', 'Branch out', 'Contract index sheet...', 'Index document', and 'Create copy'. A 'Third party contracts' section is also visible at the bottom.

Policy No.	O.	M. class	Expiration	Phase	State	Agent	Payment ...	Res...	Annu...
A800517197		KFZBD	01.07.2008	Contract	Effective	2137301	Yearly

A809273609		KFZBD	01.08.2002	Contract	Effective	2137301	Yearly		

1/5 Total 2,377.56

Buttons: Filter..., New claim, Remove application/quote, Branch out, Contract index sheet..., Index document, Create copy

Third party contracts table:

Institution	Policy No.	Main class	Expiration	State	Premium	Insured object

Buttons: Add, Remove

The contract list displays the most important information about the quotes, applications and contracts of a person.

Claim/benefit overview

Which information does claim/benefit overview include?

Overview of all claims of a person

Overview of all claims of a person as well as benefits, which the person has received from this claim.

In addition to this, claim-specific master data can be displayed.

Available functionalities: branch out to the claim file or create a new claim

ABS-Kern 14.5.04b.06 for TESTMFR is ready. Queries current

Claim/benefit overview displays the most important information about claims and received benefits of a person.

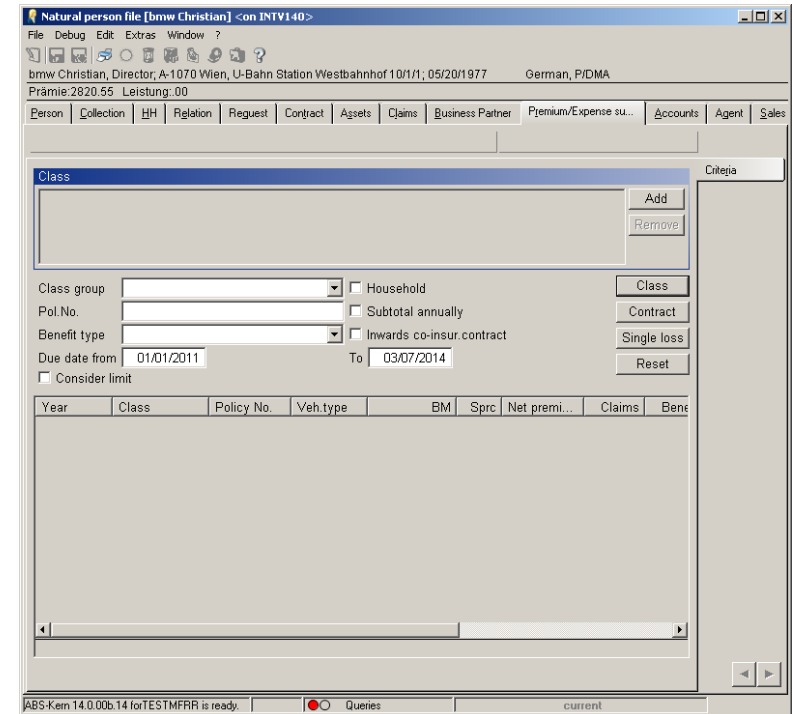

Premium and benefit overview

Which information does the premium/benefit overview contain?

Overview of all premiums and claims of a person

List of all paid premiums and benefits for all classes of all contracts of a person

Limitation to different time periods possible

The screenshot shows a software window titled "Natural person file [bmw Christian] <on INTV140>". The interface includes a menu bar (File, Debug, Edit, Extras, Window, ?) and a toolbar with various icons. Below the menu, the user information is displayed: "bmw Christian, Director, A-1070 Wien, U-Bahn Station Westbahnhof 10/1/1, 05/20/1977" and "German, P/DMA". A status bar at the bottom indicates "ABS-Kern 14.0.00b.14 for TESTMFRR is ready." and "Queries". The main area of the window is divided into several sections. On the left, there is a "Class" section with a list box and buttons "Add" and "Remove". Below this, there are fields for "Class group", "Pol. No.", "Benefit type", "Due date from" (01/01/2011), "To" (03/07/2014), and a checkbox "Consider limit". On the right, there is a "Criteria" section with buttons "Class", "Contract", "Single loss", and "Reset". At the bottom, there is a table with columns: Year, Class, Policy No., Veh.type, BM, Sprc, Net premi..., Claims, and Bene. The table is currently empty.

Premium and benefit overview displays the most important information about premiums and benefits of a person. This information is available only in direct connection.

Segmentation - customer group, target group and customer type

How can persons be assigned to different groups?

Customer group

Each person is automatically assigned to a customer group

Examples: Private customers basis or small business

Used for marketing activities or evaluations in data warehouse

Target group

Persons can be assigned to (several) target groups

Examples: Target group singles/doubles or 50plus

Used in product modelling, product selection or value pre-population can be defined depending on the target group

Customer type

Persons can be assigned (several) customer types

Examples: Nominated claim processing or person worthy of protection

Use in programmed functionalities

Intermediary/“Agent”

What lies behind the term agent?

“Intermediary” is a collective term and can be an employed sales representative, an agency or an independent broker.

Agent data

Agent data are created and maintained in the person file.

Commission accounts

Processing of an agent’s commission accounts takes place in the person file. Basic data for commission definition or calculation are maintained in the defining data.

Sales hierarchy

An agent’s sales hierarchy is displayed in the person file.

An account manager must be entered for each person. This account manager is automatically the contract manager and the commission agent.

An intermediary is created in the person file. Commission accounts (and calculation methods) are managed using the Configuration Suite.

Person merging and deletion

How can persons be consolidated and/or deleted?

	Merging	Deletion
ABS Rich Client	Select person to be merged into selected one in person file	Set deletion flag for the person
ABS Host (batch)	Reassign existing connections of source person to the target person based on defined rules	- Check whether person is still used - Delete person entry

Since references of other functional objects may exist for the person:

extensive checks are necessary before deletion

all links must be deleted during merging

Person merging is used to reduce duplicates.

- 3 Functional object Person**
- 4 Summary

Classification in the data model

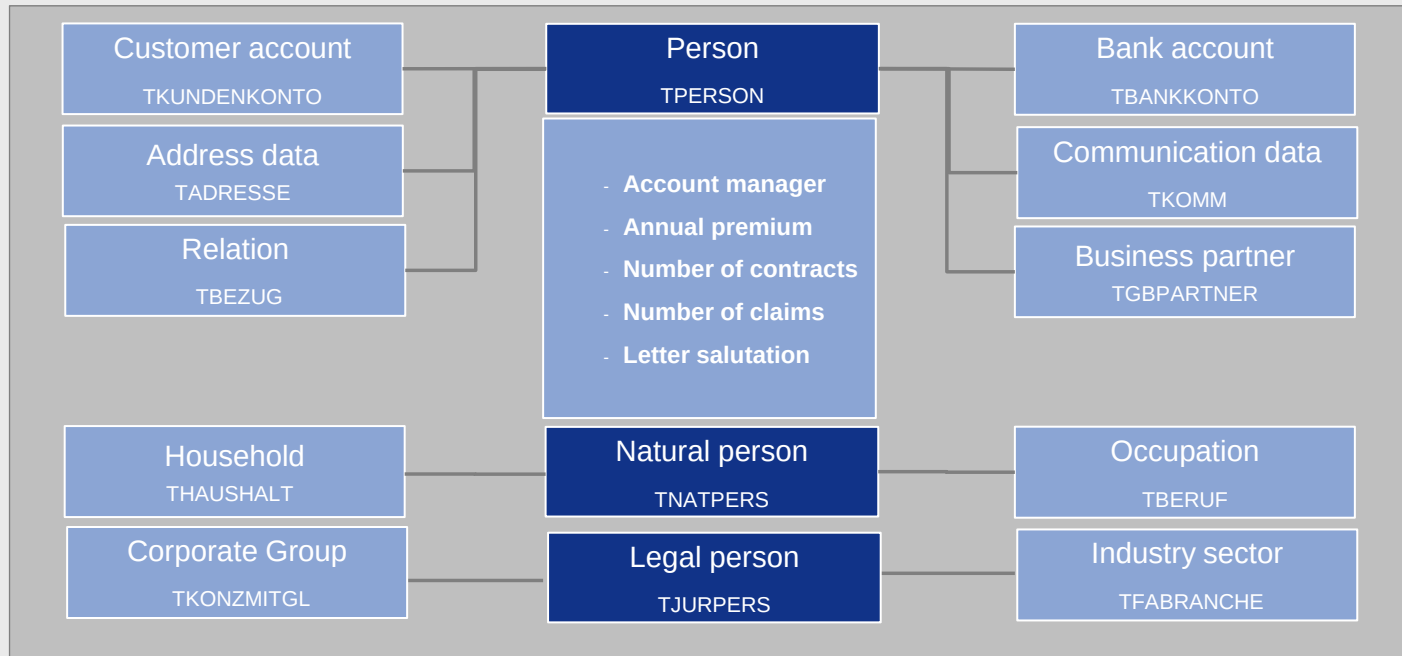

How does classification take place in UDM?

▶ Person represents the central functional object in the operational data model of ABS.

Functional object Person - extract from the data model

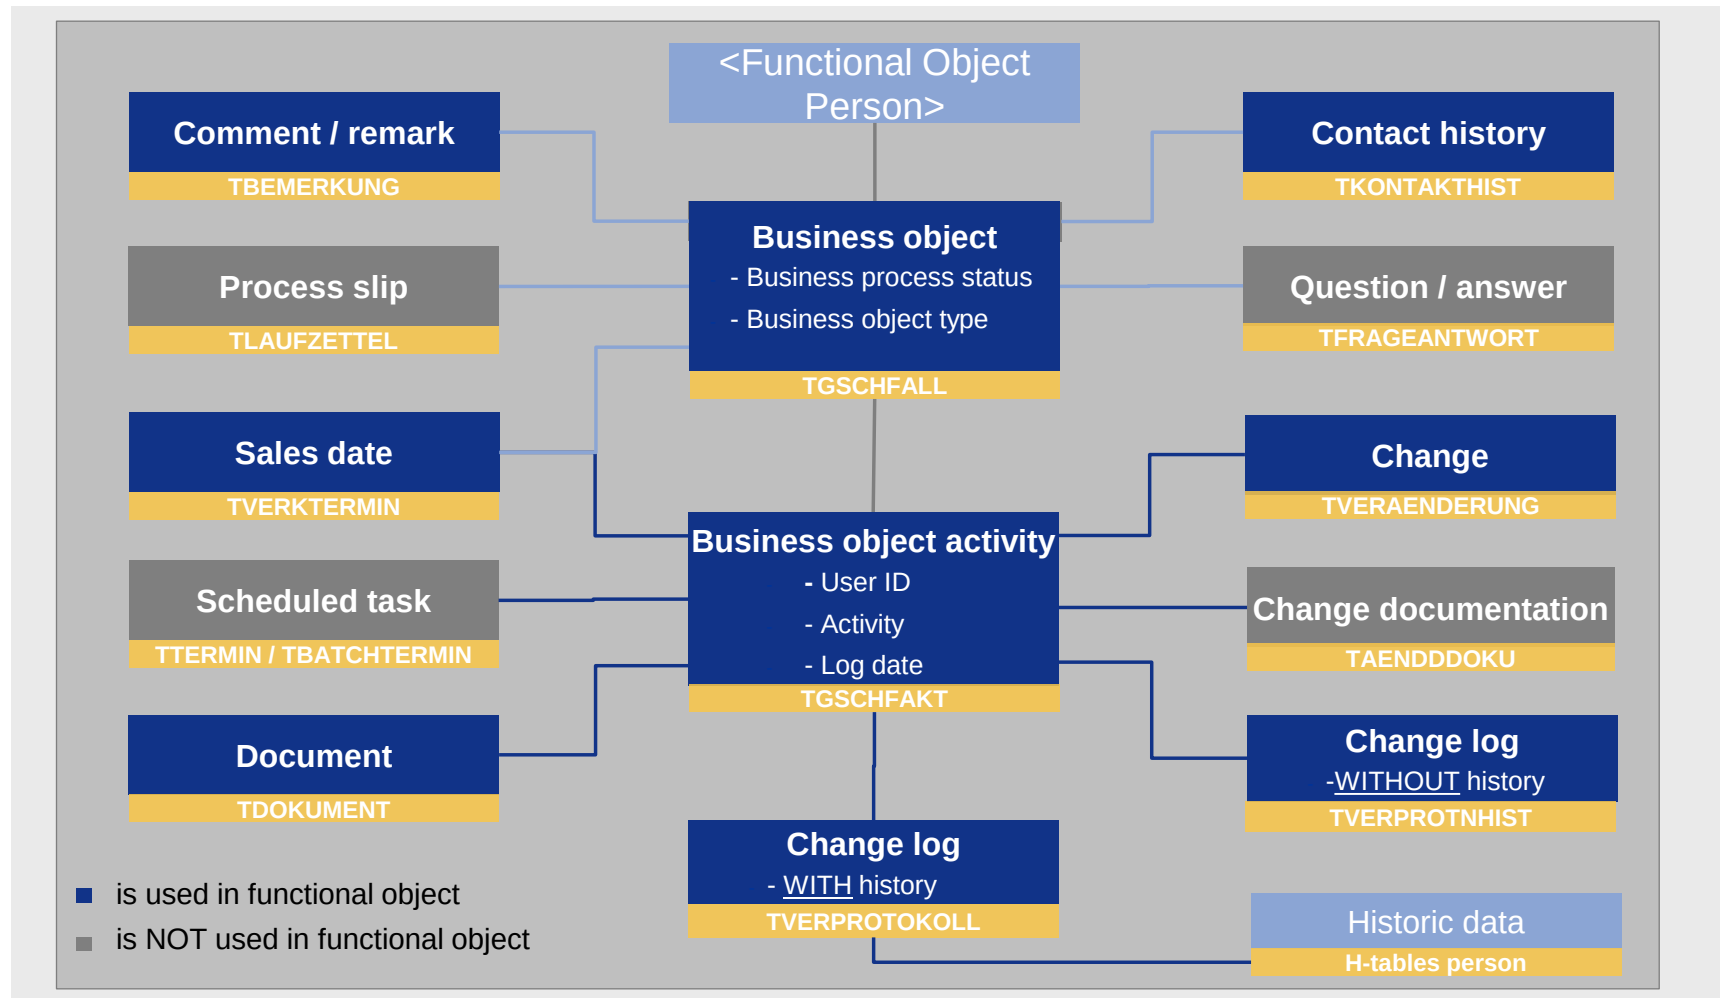

Which tables contain functional object person?

Person relevant information is stored in different tables.
The central table is TPERSON. Information available for both types of persons is stored there.
TNATPERS and TJURPERS are used to store type specific data.

Business object functions

How are the tables of the business object connected to each other?

Functional object Person uses many business object functionalities. Historization of person is required for correct reproduction of historical contract status.

- 4 Summary**

Summary

What should we keep in mind?

You should now have knowledge about the following:

- An overview of the used person types and roles
- Edit and query of person master data and communication data
- Relations a person can have within ABS.
- Segmentation in person management
- Additional information available in person management
- Embedding the Functional Object Person in the data model
